Customer Reviews

Like other books/articles on Vitamin K/K2, this book IGNORES an exploration of the 'elephant in the room', and arguably the most important aspect, namely, WHAT EXACTLY IS THE RISK OF BLOOD CLOTTING/THROMBOSIS from taking K2 (and/or K1)? Is it because Vitamin K makes the blood more sticky? It is clearly a REAL possibility, from the WARNING given that those on Warfarin or other blood thinning drugs should NOT take these vitamins. This aspect is glossed over in my opinion, because it is not fully explored. This then begs the question WHAT CAN BE DONE in advance of such a decision? What about the possibility of an emergency operation? What, if anything, can doctors do to obviate the danger of thrombosis in such an event? Shouldn't one indicate this on hospital admission forms? What about this danger on long haul airplane journeys? How long before such a journey would one need to stop taking this vitamin? Does this then also mean that those taking a small dose of Aspirin daily are throwing their money away if they also take a Vitamin K supplement? What about first having a Carotid scan done to see if there is or is not a build up of plaque or Calcium in one's arteries, and thus whether or not one needs to take Vitamin K? Even without a history of stroke or heart disease, is it possible that a PI test might be able to say if certain individuals have a greater tendency to "sticky" blood than others? In other words, I have a distinct uneasiness when the dangers are not as fully explored as the benefits whenever a "new" drug or Vitamin suddenly becomes the "flavour of the month" in the published texts. Suddenly one is being told that taking Vitamin D plus Calcium without Vitamin K2 might have put us at great risk for heart disease.
